

Polyclonal Antibody That Recognizes the Sulfonylurea Receptor 1 Isoform

INVENTORS • Jonathan Makielski, Nian-Qing Shi, Bin Ye

WARF: P07041US

Assigned to WARF as biological material.

The Wisconsin Alumni Research Foundation (WARF) is seeking commercial partners interested in developing antibodies that specifically recognize sulfonylurea receptor isoforms and splice variants.

OVERVIEW

Sulfonylurea receptors (SURs) regulate the opening and closing of ATP-sensitive potassium channels (K_{ATP}). They play important roles in insulin secretion in the pancreas and myocardial protection in the heart. At least two isoforms of SUR exist, and the mRNA from each isoform can be spliced in different ways to result in further variants of SUR. The SUR1 isoform encodes the high-affinity sulfonylurea receptor, which is found in pancreatic beta-cells, while the SUR2 isoform encodes the low-affinity sulfonylurea receptor, which is mainly present in mitochondria-rich cardiac, smooth and skeletal muscles.

Antibodies would be a useful tool to further investigate SURs. However, commercially available antibodies do not distinguish between SUR variants. Additionally, available antibodies yield variable results and have not been rigorously tested for specificity.

THE INVENTION

UW-Madison researchers have developed an antibody, known as BNJ1, that specifically recognizes SUR1. It can be used in combination with other antibodies developed by the inventors (see WARF reference numbers P08021US, P08022US, P08023US and P08024US) to distinguish SUR isoforms and splice variants.

APPLICATIONS

- Provides a useful tool for further investigating SURs

KEY BENEFITS

- Tested for specificity in mouse heart, brain and liver cells, as well as dog and human heart cells

THE WARF ADVANTAGE

Since its founding in 1925 as the patenting and licensing organization for the University of Wisconsin-Madison, WARF has been working with business and industry to transform university research into products that benefit society. WARF intellectual property managers and licensing staff members are leaders in the field of university-based technology transfer. They are familiar with the intricacies of patenting, have worked with researchers in relevant disciplines, understand industries and markets, and have negotiated innovative licensing strategies to meet the individual needs of business clients.

- Affinity purified

STAGE OF DEVELOPMENT

This antibody was successfully tested against stable cell lines expressing KATP channels.
