

Isolated Influenza H3N2 Virus for Potential Feline Vaccine

INVENTORS • Kathy Toohey-Kurth, Jennifer Cooper, Francine Cigel, Sandra Newbury

WARF: P160347US01

Assigned to WARF as biological material.

The Wisconsin Alumni Research Foundation (WARF) is seeking commercial partners interested in isolated H3N2 influenza virus that caused an outbreak in canines in 2015 and appears to have spread to cats.

OVERVIEW

According to the Centers for Disease Control, a canine influenza A H3N2 virus caused an outbreak of dog flu reported in the Chicago area in 2015 that has since spread across 25 states. Research by the Wisconsin Veterinary Diagnostic Laboratory (WVDL) suggests the same strain is now responsible for a 2016 outbreak among cats in an animal shelter.

In both felines and canines, influenza is a contagious respiratory disease that can spread rapidly in shelters and kennels. Symptoms range from mild (e.g., runny nose, cough) to severe, and sometimes can be fatal.

An H3N2 vaccine is now available for dogs, but no vaccine is currently approved or recommended for cats.

THE INVENTION

Researchers from the Wisconsin Veterinary Diagnostic Laboratory have isolated H3N2 influenza virus from felines infected during the 2016 outbreak. Characterization and sequencing efforts are ongoing.

APPLICATIONS

- Development of influenza vaccine for cats

KEY BENEFITS

- Potential first vaccine of its kind

THE WARF ADVANTAGE

Since its founding in 1925 as the patenting and licensing organization for the University of Wisconsin-Madison, WARF has been working with business and industry to transform university research into products that benefit society. WARF intellectual property managers and licensing staff members are leaders in the field of university-based technology transfer. They are familiar with the intricacies of patenting, have worked with researchers in relevant disciplines, understand industries and markets, and have negotiated innovative licensing strategies to meet the individual needs of business clients.

STAGE OF DEVELOPMENT

Researchers at WVDL are currently completing a full genetic analysis and study of the virus.
