

# Saddle Lift to Enhance Independence of Horseback Riders with Disabilities

**INVENTORS • Shanna Burris, Dean Olson**

WiSys: T170002US02

[View U.S. Patent #10,519,028 at Google Patents](#)

**WiSys Technology Foundation is seeking a strategic partner for manufacturing, marketing, sales, and distribution of a lift that allows para-questrian riders to independently saddle their horses.**

## OVERVIEW

Horseback riding is used therapeutically for riders with many types of disabilities caused by, for example, amputation, cerebral palsy, muscular dystrophy, multiple sclerosis, paralysis, spina bifida, or spinal cord injury. In many of these cases, riders who are normally restricted to a wheelchair utilize a horse's movement to improve their motor skills, coordination, balance, and core strength. Therapeutic horseback riding and the related practice of hippotherapy are used worldwide. In fact, over 870 member centers from over 40 countries in the Professional Association of Therapeutic Horsemanship (PATH) International serve more than 62,000 riders every year. There have been many technologies developed to promote independence of therapeutic riders, including ramps and other devices to help the riders themselves mount their horses. However, a major gap that exists in facilitating independence, especially for riders that are wheelchair-bound, is getting the saddle onto the horse before riding. Saddles can weigh as much as 50 pounds, and a horse's back can be four to six feet off the ground, too high to saddle from a seated position. Due to these restrictions, therapeutic riders typically need assistance in saddling the horse for them, hindering the riders' ability to independently execute the full horseback riding experience.

## BUSINESS OPPORTUNITY

### THE WISYS ADVANTAGE

WiSys Technology Foundation serves the University of Wisconsin System comprehensive campuses by patenting and licensing discoveries to leading companies in Wisconsin, the United States and worldwide. Established in 2000 by the Wisconsin Alumni Research Foundation (WARF) and the UW System, WiSys is building the next generation of patent and licensing opportunities by fostering collaborations among campuses, private research organizations and industry, facilitating high-tech research with grant programs, and promoting student training for employment in a knowledge-based economy. WiSys's income is distributed to the UW campuses, the inventors and their departments to grow future discoveries and educational opportunities.

UW-River Falls innovators with expertise in nursing, animal science, and engineering have developed an easy-to-use system capable of lifting a saddle onto a horse by users who are in a seated position below the height of the horse, such as in a wheelchair. The saddle lift can be installed on site in stables and uses a system of hooks and pulleys to lift any type or size of saddle with little force from the user. The system can be moved over the horse, so the horse itself does not have to be precisely positioned. Once the saddle is on the horse, the user can easily release the hooks by adjusting the tension on the lift's rope. The rider is also able to tighten the saddle straps and secure the saddle from a seated position without external assistance. The novel design of this saddle lift technology provides for a critical advancement in helping therapeutic riders achieve independence.

## APPLICATIONS

- Enhances independence of riders with disabilities by assisting them in getting the saddle onto the horse by themselves

## KEY BENEFITS

- System comprised of a self-releasing/unlocking mechanism for ease of use
- Adjustable to all saddle types
- Easy to use with minimal training
- Pulleys reduce effort needed to lift weight of saddle
- Avoids damage to saddle

## STAGE OF DEVELOPMENT

A prototype has been developed with support from the McNair Scholars Program and the UW-River Falls Agricultural Engineering Department. The prototype has been tested by a person with physical disabilities saddling a live horse. Minor adjustments may be made to optimize comfort for the user and aesthetics, but the current prototype design is fully functional.

## ADDITIONAL INFORMATION

### Tech Fields

Agriculture - Mechanization

Education & Training - Medical & health
