

METHOD AND APPARATUS USING BLENDED BIOMETRIC DATA

[View U.S. Patent No. 11,886,561 in PDF format.](#)

WARF: P210077US01

Inventors: Varun Chandrasekaran, Rahul Chatterjee, Xiaohan Fu, Jin-Yi Cai, Suman Banerjee

The Invention

Researchers from UW Madison and UC San Diego have developed a biometric processing system for authentication. It combines multiple biometric signals using machine learning to map the different signals into a common argument space that may be processed by a similar fuzzy extractor. The different biometric signals may be given weight values related to their entropy allowing them to be blended to increase security and availability while minimizing intrusiveness.
